LITEPAPER

VANITY CONTRACT

Programming Language: Solidity

Solidity Version: 0.8.0

Chain: Binance Smart Chain (BEP20)

Audited by Solidity.Finance

TOKENOMICS

Total Initial Supply : 10.000.000.000 \$VNY

Redistribution to \$VNY Holders: 4%

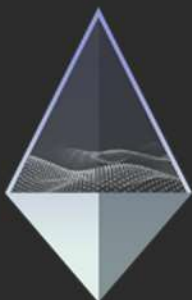

Burn with Every TX: 2%

Reflection to Marketing/Vanity Wallet: 2%

Deposit in LP (Locked): 2%

TOTAL FEE ON TRANSACTIONS: 10%

VANITY FUNCTIONS

LP AUTO-DEPOSIT

Every transaction made with \$VNY is taxed for a total of 10%, where 2% is deposited inside the \$VNY smart contract. When a total of 500k \$VNY has been deposited, the smart contract will wait for a sell to swap 50% of the tokens into BNB, depositing the pair in the Liquidity Pool, locked for 3 years.

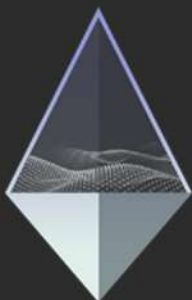

ANTI-WHALE SYSTEM

Every investor holding 0.15% or more of total supply is limited to one sell per day, for a maximum amount of 10% of their holdings. Once the sell has been done, a block will be applied for 24 hours. The % will be lowered in the future to prevent holders below 0.15% to dump while the price action raises.

DEFLATIONARY SYSTEM

The \$VNY tax includes a 2% tax on every \$VNY transaction, where this fee is directly sent to the burn address, reducing circulating supply.

VANITY FUNCTIONS

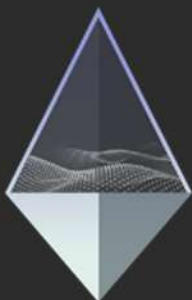

REWARD SYSTEM

Included in the \$VNY tax is a 4% redistribution to holders. The amount each holder receives is proportional to the percentage of \$VNY they hold. Holding \$VNY gives you passive income in the form of redistributed tokens!

MARKETING/VANITY WALLET

Included in the \$VNY tax is 2% that is sent to the marketing wallet, recognizable as the 0xFEE0FEE0 address. This is used for marketing purposes and for \$VNY server management. Creating a custom \$VNY address requires machines able to combine high computing power from dedicated GPUs.

VANITY PROJECT

WHAT IS VNY?

\$VNY is the first token ever released on any blockchain to provide custom wallet addresses for Bitcoin, Ethereum, Binance Smart Chain, Litecoin and Dogecoin Chains.

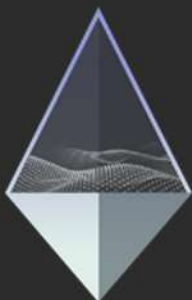

CUSTOM WALLET ADDRESSES

A vanity address is a customisable non-proxy address. The addresses generated are the new ones visible in the block chain explorers. Supporting different blockchains such as \$VNY that can generate Vanity wallet addresses in many shapes and block chains.

THE GOAL

\$VNY aims to be the distribution leader of their product for companies accepting crypto, miners interested in sorting their rigs income, holders that want to instantly recognise their wallet from a multitude of others, people looking to display their customised wallet, users feeling safer to send crypto to an address they recognise, and many more.

VANITY PROJECT

THE GENERATION

The product generated on the VANITY marketplace is fully secure, meaning no one else other than the requester of the address will be able to obtain the private key needed in order to generate the Vanity wallet address.

The \$VNY Team, utilising the customer's public key, will output a string of code called a partial private key. It is generated using powerful GPUs, and is correlated to the requested Vanity address. Once the customer receives the string, the only step required will be merging it with the original private key using a the \$VNY Platform.

This merge process will create the new keys for the new Vanity custom wallet address.
